pastebin-django

Introduction

A pastebin web application programmed in Python using Django web framework. The web application allows both visitors and registered users to upload and view pastes. Registered users can also add comments to pastes, delete their own pastes and mark certain pastes as favorites.

Database

Uses PostgreSQL as the relational database. Data is retrieved, added, updated, etc. using raw SQL queries instead of Django's database-agnostic ORM model.

Other details

Uses Django's in-built authentication system for user registration and login, as this reduces the amount of boilerplate code and is likely more secure than a custom-built solution.
